

# PHYSICAL DESIGN FOR RELATIONAL DATABASES

@SIT, KMUTT  
Bsc.IT. 2/2020

# Database Design

# Steps of the **physical** database design

# How to design file organizations and indexes

Analyze transactions

**Choose file organizations**

Choose indexes

Estimate disk space  
requirements

# Choose file organizations

- The physical arrangement of data in a file into records and pages on secondary storage to **store and access data in an efficient way.**
- Types of file organizations
  - **Heap**
  - **Sequential**
  - **Hash**
  - Indexed Sequential Access Method (ISAM)
  - Clusters

# Logical Record

- It is a record designed in the phase of logical database design.
- It contains fields which have values of a particular type, which may be fixed length or variable length

# Physical Record

- It is known as block or page
- It is a unit of transfer between disk and memory
- Normally, one block stores a number of records.
  - Blocking factor refers to the number of records per block.
- There may be empty space in a block if an integral number of records do not fit in one block.

# Application loads logical records from the physical records

Application buffers: DBMS Buffers: Operating sys  
 Logical records (LRs) Logical records (LRs) Physical reco  
 of physical records (PPRs) on disk

# Logical and physical record

(a) Multiple LRs per FR

(b) LR split across FRs

(c) FR containing LRs from different tables

# How to design file organizations and indexes

Analyze transactions

Choose file organizations

**Choose indexes**

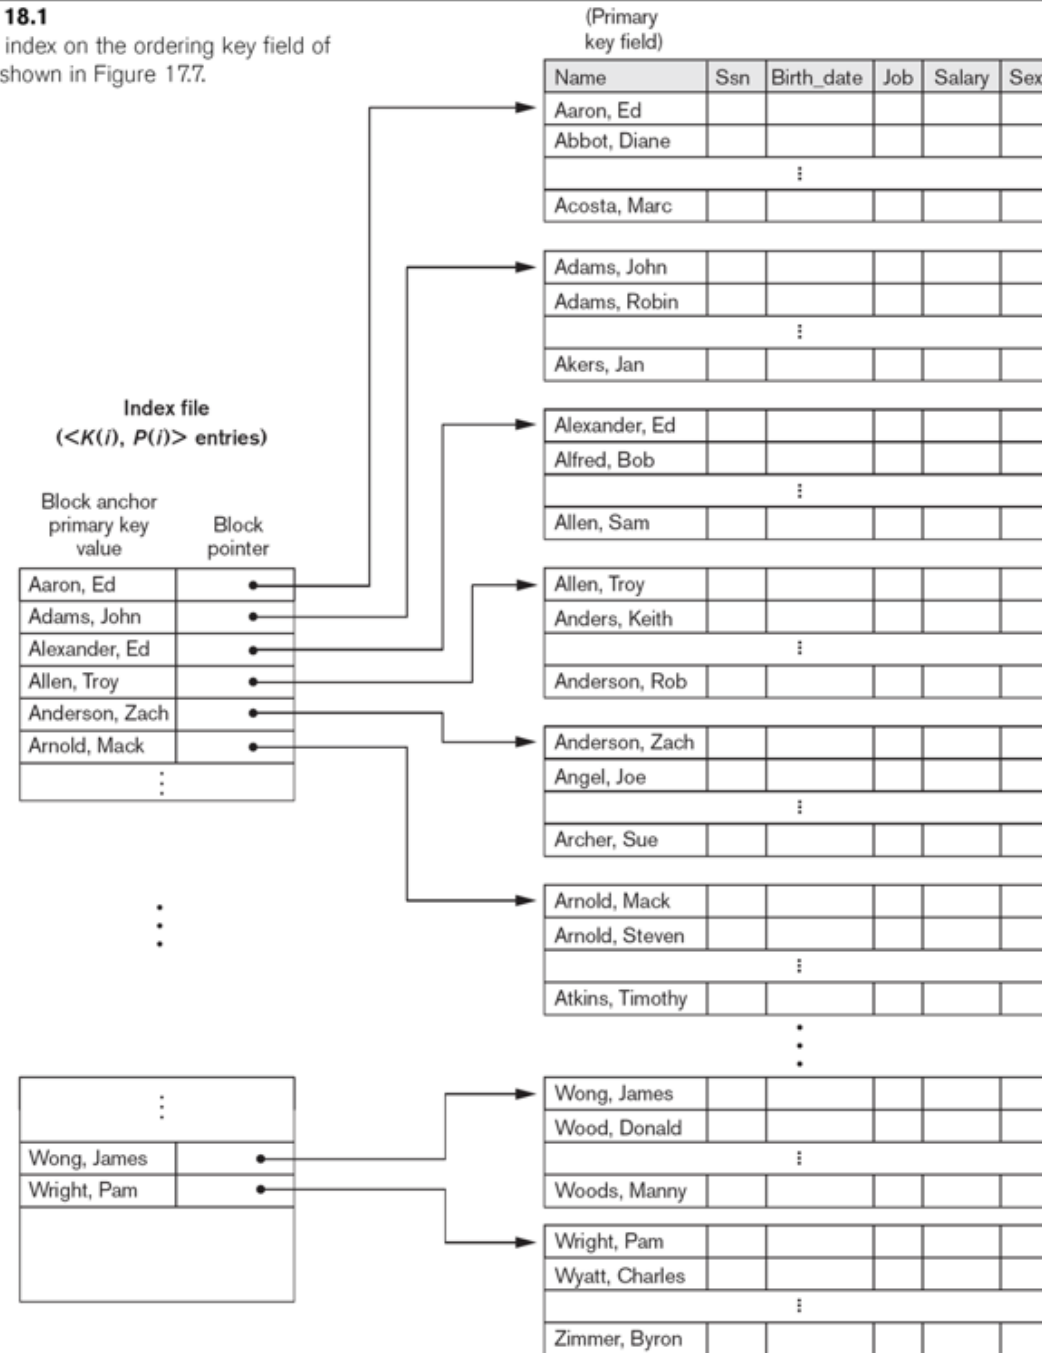

Estimate disk space  
requirements

# What is an Index?

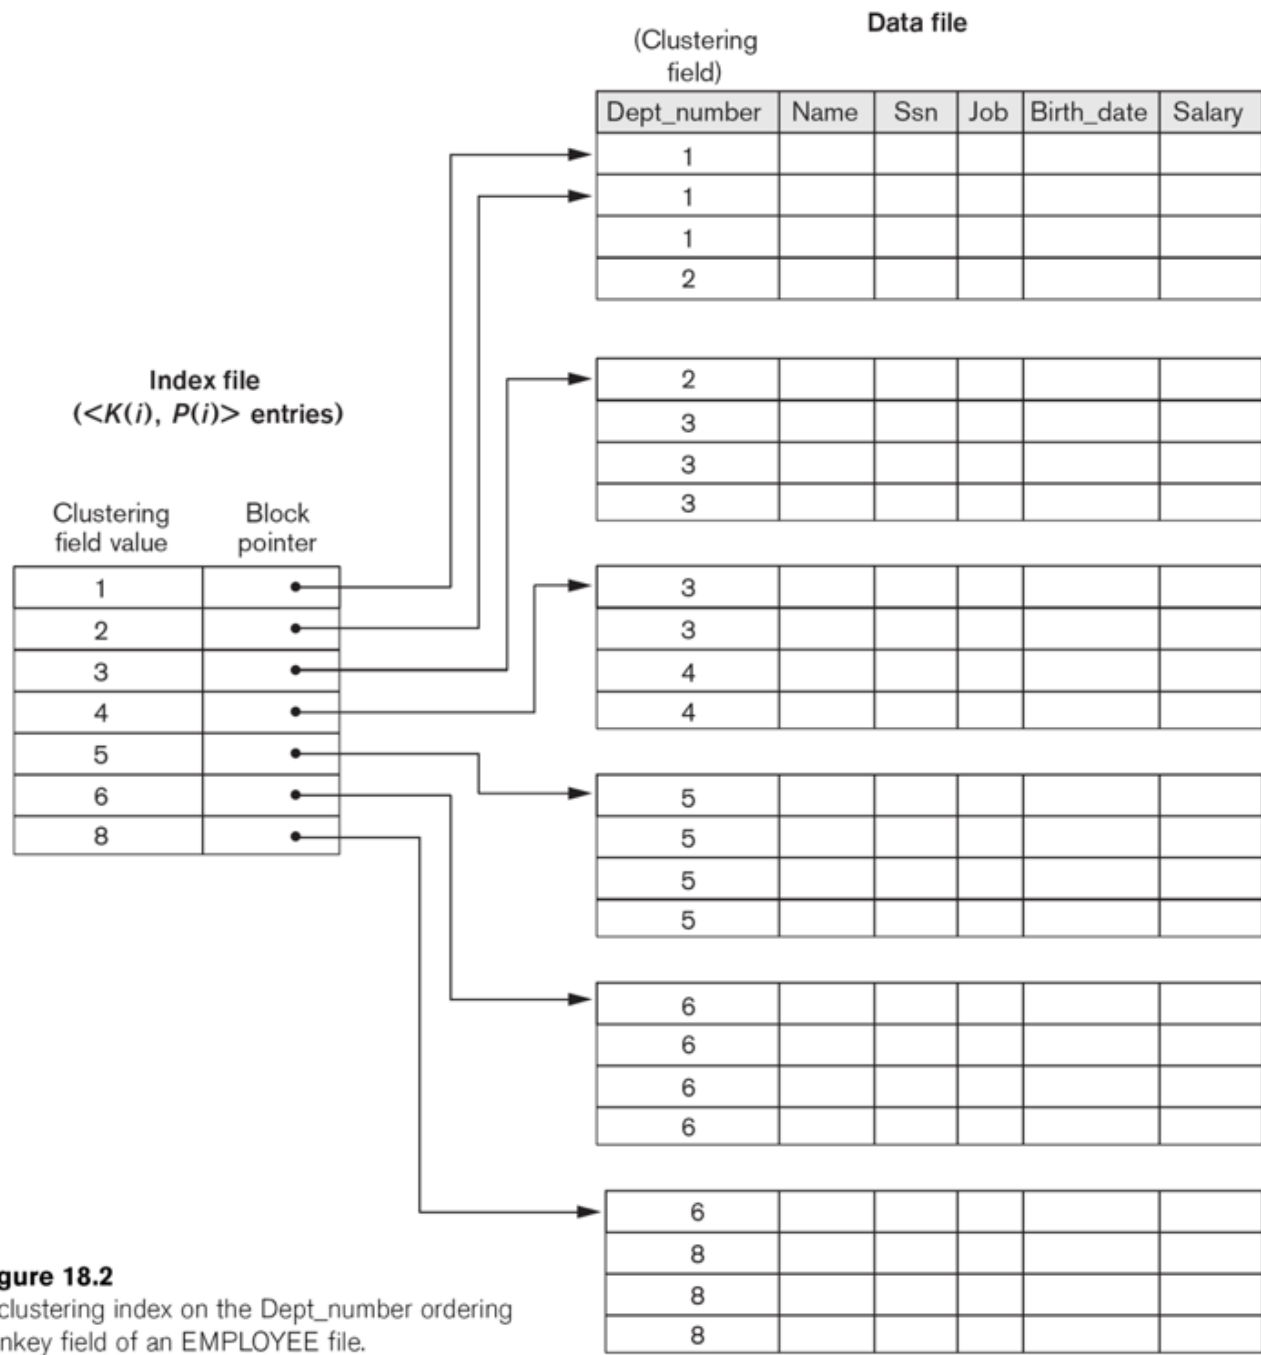

- To locate records in a file more quickly
- Is an auxiliary structure file (**index/key file**) associated with a file (**data file**)
- An index structure (index file) consists of:
  - A **key** value of the selected field.
  - The **address** of logical record.
- Types of Index
  - Primary Index is ordered by an ordering key field to guarantee to have a unique value
  - Secondary Index is ordered by a non-ordering field, and may not contain unique value
  - Clustering Index is ordered by on a non-key field
- A file can have at least one primary index or one clustering index, zero or several secondary indexes

# Primary Index

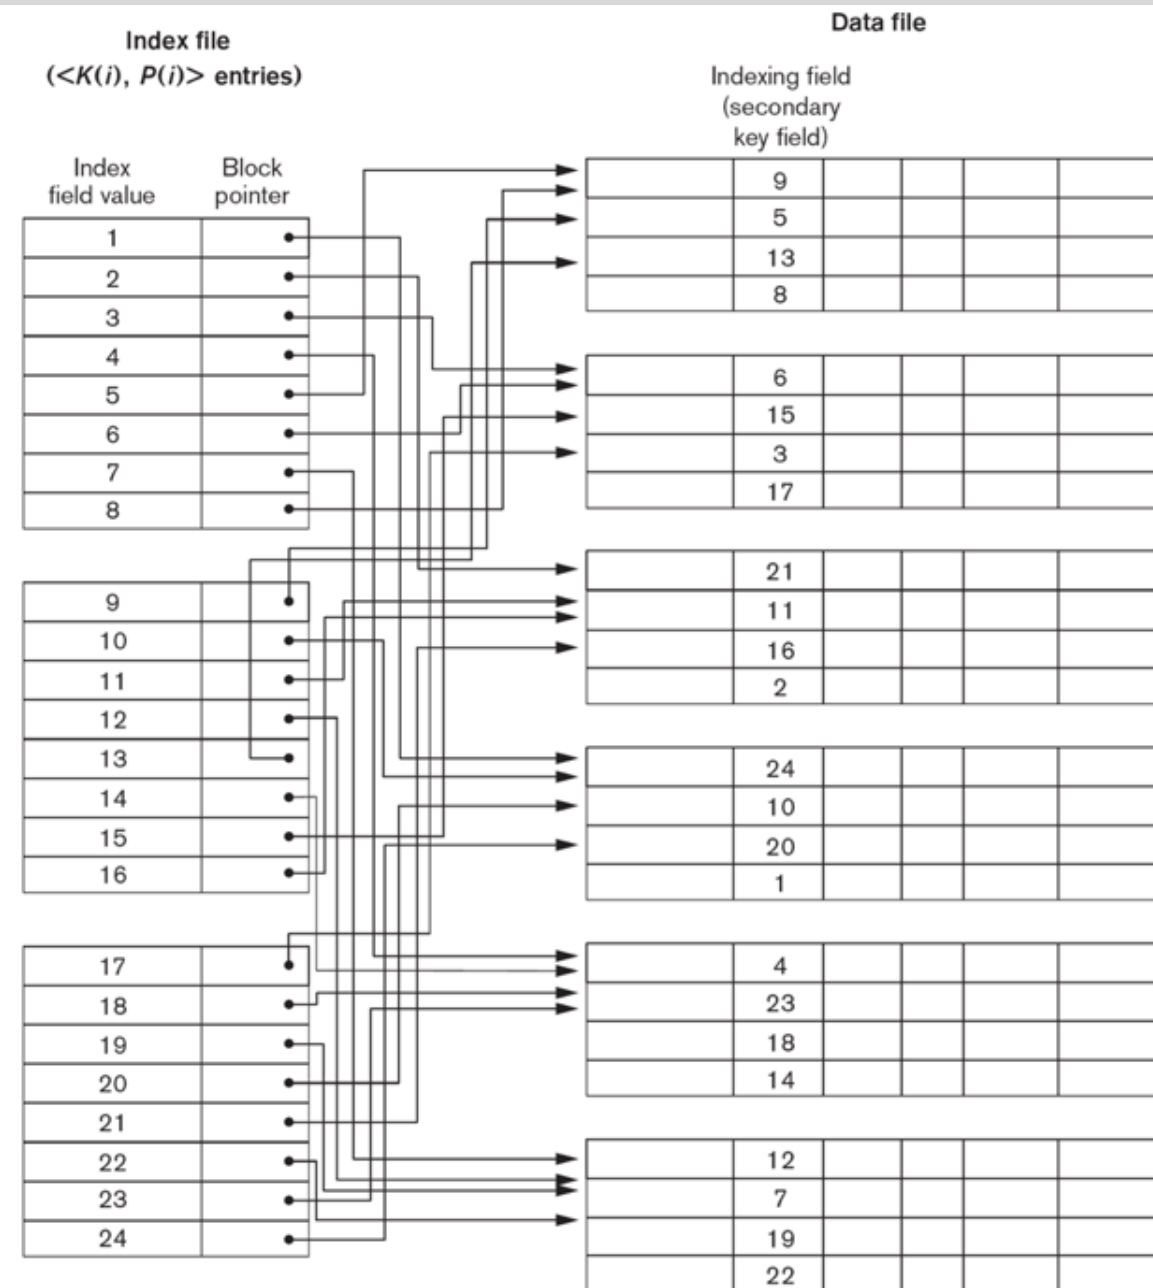

**Figure 18.1**  
Primary index on the ordering key field of  
the file shown in Figure 17.7.

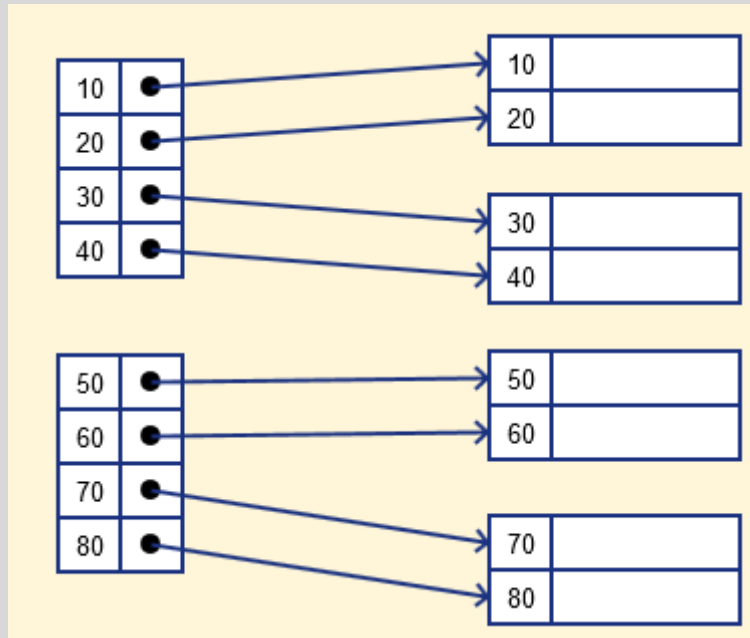

# A Clustering

# Secondary Index

# Dense & Sparse Index

Dense Index

Sparse Index

# B-tree index v.s. Bitmap index

<b>B-Tree</b>	<b>Bitmap</b>
